PPC-A55-185 Power Input

Power Input

The PPC-A55-185 Industrial Panel PC can be powered by a wide range of input voltages: From 12V to 36V DC. The power input connector is a **3-pin, 3.81mm terminal**. The polarity and the pinout is clearly marked on the housing of the product as shown in the figure below.

Power Input

Note that the "+" sign represents the positive power input, it is printed at the casing and as a silk-screen on a PCB of the embedded version. The "-" terminal is shorted to the ground.

Power Input Definition			
Pin Number	Definition	Description	
Pin 1	Positive Input	DC Power Positive Terminal	
Pin 2	Negative Input	DC Power Negative Terminal	
Pin 3	Ground	Power System Ground

The system ground " \mathbf{G} " is connected to power negative "-" on board.

PPC-A55-185 Touch Screen

Touch Screen

The PPC-A55-185 Industrial Panel PC uses a 10-point capacitive touch screen. However, the Debian OS supports only One-Point touch.

The figure below shows the capacitive touch screen connected to the motherboard via the **USB connector**.

Figure 644: Capacitive Touch Connector

Attention

A capacitive touch screen is susceptible to power noise and Electromagnetic Radiation (EMR). It may cause LCD ripples or even capacitive touch malfunction. If using a capacitive multi-touch test application, you might notice the touch points float erratically across the display. There are several solutions to this problem:

- 1. Use a high-quality Power Adapter Unit (PSU) with low EMR. You can also provide power from a battery.
- 2. Make sure that the PPC-A55-185 Power Input connector (pin 3) is properly connected to the Power System Ground to provide sufficient EMI shielding and eliminate the problem entirely.
- 3. Bad GND problem can also be confirmed by touching pin 3 of the Power Input connector with one hand while operating the capacitive touch screen with the other hand. In this case, the operator's body acts as the Power System Ground.

PPC-A55-185 Connectivity

Connectivity
